J. Batteriol. 180:2005-2013(1998).
J. Subrative Siding clamp (Gp45) loader. Required for elongation of primed templates by DNA polymerase. Possesses DNA-dependent ATPase activity on its own and within the heterodimer Gp44/Gp62.
J. Subult: Heterodimer of Gp44 and Gp62 that forms a complex with Gp45 in the presence of ATP.
J. SIMILARITY: PARIIAL TO E.COLI DNA POLYMERASE III SUBUNITS.
GAMMA/TAU AND TO HUMAN ACTIVATOR 1, 37 AND 40 kba SUBUNITS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MTSSQQRVERFLQYFSAGCKTPIHLK--DGVCALYNEQDEEAAVLEVPQHSDSLLLHCRI

C.!- FUNCTION: Catalyzes the NADPH dependent reduction of Legamma-
glutamyl S-phosphate into L-glutamate S-semialdehyde and
Phosphate. The product spontaneously undergoes cyclization to form
                                                                                                                                                                                                                                                                                                                                                              9

NADP(+) = L-gamma-glutamyl 5-phosphate + NADPH.

PATHWAY: Proline biosynthesis; second step.

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SUMILARITY: Belongs to the gamma-glutamyl phosphate reductase
                                                                        (POTENTIAL).

TISSUE SPECIFICITY: Highly expressed in pancreas and to a lesser
extent in skeletral muscle, heart, brain and placenta. Present in
trace amounts in lung and liver.
SIMILARITY: Contains 12 TPR repeats.
                                                                                                                                                                                                                                                                                                    Event=Alternative splicing; Named isoforms=2;

J. Biol. Chem. 272:9308-9315(1997).
-!- FUNCTION: Addition of nucleotide-activated sugars directly onto
the polypeptide through O-glycosidic linkage with the hydroxyl of
serine or threonine.
-!- CATALYTIC ACTIVITY: UDP-N-acetyl-D-glucosamine + peptide = UDP +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -!- TISSUE SPECIFICITY: Appears to be present in all tissues examined except kidney.

"Identification of an evolutionarily conserved superfamily of DOCK180-
"Identification of an evolutionarily conserved superfamily of DOCK180-
related proteins with guanine nucleotide exchange factor (GEF). GEF
-!- FUNCTION: Potential guanine nucleotide exchange factor (GEF). GEF
-proteins activate some small GTPases by exchanging bound GDP for free GTP (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Indels 39; Gaps

Genome polyprotein (Contains: Coat protein VP4 (PlD); Coat protein VP2 (PlB); Coat protein VP3 (PlC); Coat protein VP4 (PlD); Picornain 2A (EC 3.4.22.29) (P2A); Core protein P2B; Core protein P2C; Core protein P3A; Genome-linked protein VPG (PSB); Picornain 3C (EC 3.4.22.28) (Protease 3C) (P3C); RNA-directed RNA polymerase (EC 2.7.7.48) (P3D)].
Echovirus 9 (strain Barty)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           poliovirus polyprotein. In other picornavirus reactions Glu may be substituted for Gln, and Ser or Thr for Gly.

CATALYTIC ACTIVITY: Selective cleavage of Tyr-|-Gly bond in the picornavirus polyprotein. In other picornavirus reactions Glu may be substituted for Gln, and Ser or Thr for Gly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zimmermann H., Eggers H.J., Nelsen-Salz B.,
"Molecular cloning and sequence determination of the complete genome
of the virulent echovirus 9 strain Barty.",
Virus Genes 12:149-154(1996).
-i- FUNCTION: P2A AND THE P3C POLYPEPTIDES ARE PROTEASES THAT CLEAVE
AT CERTAIN Q/G SITES IN THE POLYPROTEIN. THEY ARE CYSTEINE
                                                                                                                                                                                                                                                                                                                                                                                                               Viruses; ssRNA positive-strand viruses, no DNA stage; Picornaviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              VP3, and VP4.

-!- PTM: Specific enzymatic cleavages in vivo yield mature proteins. CLEAVAGE BETWEEN VP4 AND VP2 IS AUTOCATALTYIC; VP1/PDA IS CATALYZED BY P2A; ALL OTHER CEAVAGES ARE CATALYZED BY P3C.
-!- SIMILARITY: P2A PROTEASE BELONGS TO PEPTIDASE FAMILY C3.
-!- SIMILARITY: P3C PROTEASE BELONGS TO PEPTIDASE FAMILY C3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- SUBUNIT: The virus capsid is composed of 60 icosahedral units, each of which is composed of one copy each of proteins VP1, VP2,

"Cloning and characterization of Manduca sexta and Plutella
xylostella midgut aminopeptidase N related to Bacillus thuringiensis
toxin-binding proteins.",
Eur. J. Biochem. 248:748-761(1997).
-!- CATALYTIC ACTIVITY: Release of an N-terminal amino acid, Xaa-|-
XDb- from a peptide, amide or arylamide. Xaa is preferably Ala,
but may be most amino acids including Pro (slow action). When a
terminal hydrophobic residue is followed by a prolyl residue, the
two may be released as an intact Xaa-Pro dipeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  12 LQYFSAGCKTPIHLKD---GVCALYNEQDEEAAVLEVPQHSDSLLLHCRIIEADPQTSIT

-!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
-!- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.
-!- SIMILARITY: Belongs to peptidase family M1.
                                                                                                                                                                                                                                                                                                                                                              AMINOEPTIDASE N.
